### I. Assembly Drawing.

1) Handle Bar Grip 2) Pressure Adjuster 3) Heating Element 4) Digital Controller

5) Limit Switch 6) Power Switch

### **II. Technical Parameters**

- 1. Model No.: HPD.MP300
- 2. Machine Dimension: 310\*290\*150mm
- 3. Heating Element Size: Dia.6-7.5cm for 6oz, 9oz, 10oz etc. Mug Dia.7.5 9.0cm for 11oz, 15oz etc. Mug
- 4. Printable Articles Max Size: Ø100\*120mm
- 5. Voltage: 220V/1Phase; 110V/1Phase
- 6. Power: 0.3kW
- 7. Recommend Setting: 30~280s; 180~200°C
  Time Range: 0~999s
  Maximum Temp: 225°C
- 8. Packing Size: 41\*39\*33cm
- 9. Gross Weight: 4.75kg/4.85kg/6.3kg

### III. Operating Process.

#### 1. Set temperature required.

#### 2. Set time required

TEMP Time CD-L OK	TEMP TIME CD-L	Hot Port TIME Cold Port OK	
Press 🕅 button after temperature	Press 🕅 button after time setting;	Note: There are two small	
setting and the time light is	the display shows the temperature ports in the front side of		
	starts to rise. "CD-L" shows the time	digital display. If the real temperature is lower	
on. Using the arrows select the	counting down during your transfer.		
time according to different transfer		than digital controller shown,	
material.		you can adjust the "hot port";	
		Clockwise to	
		Raise the temperature;	
		anticlockwise to reduce the	
		temperature.	

**NOTE:** If 'LO' appears on the display, this is part of the program. Once the temperature rises to approx. 100°C the display will change from 'LO' to the actual temperature.

#### 3. Printing methods.

Step 1: Make sure the cord is connected firmly to the wall socket. Place the Mug in the heating element and then put transfer paper, with image facing down, onto the Mug. Adjust the pressure to your requirement, and turn on the power. P.S: Use heat resistant tape to fix the transfer paper, making sure the transfer paper is securely attached to the Mug and is in the correct position.

Step 2: Set the temperature and time required (see above) and the temperature will start to rise.

Step 3: When the temperature has risen to the setting required, the buzzer will sound; you can then close the heating element, (in the meantime the buzzer will stop). This starts the transfer cycle.

Step 4: When the timer has counted down to zero, remove the Mug from the heating element and peel transfer.

#### 4. Recommendations:

Ceramic Mug transfer: (These settings are dependent on transfer paper, ink and mug type used and should be used for guidance only)

- Set temperature: 200°C.
- Set time: 240 seconds.

### IV. Maintenance.

#### 1. The machine will not work after you turn on the power.

- 1). Check the plug is connected well or that it is not broken.
- 2). Check the power switch or digital controller is not broken.
- 3). Check the fuse is not blown.
- 4). Indicating light is on, but no display on screen, check the 5 cable of Railway transformer. If it is loose, this indicates that the problem is poor connection. If it is securely connected, it indicates that the Transformer is faulty.

#### 2. The display screen is working well, but the heat platen temperature does not rise.

- 1). Check whether the thermocouple of the heating element is secure. If the thermocouple is loose, the display will show 255°C and the machine will keep beeping.
- 2). Check if the indicating light of the solid-state relay is on. If not, check if the relay or digital controller is broken.
- 3). If you have already replaced the solid-state relay for a new one but the heating element will still not heat up, then check to see if the heat platen is faulty or the heating elements power cable is loose, you may need a new heating element.

#### 3. The heating element works well, but suddenly the display screen shows 255°C.

- 1). Check whether the thermocouple is secure.
- 2). If the thermocouple is firmly attached but the controller still shows 255°C, then it is faulty.
- 4. The machine is heating between 0~180°C, but the display number jumps to above 200°C or 300°C suddenly, or the numbers on the display jump irregularly.
- 1). Check whether the thermocouple of the heating element is firmly attached.
- 2). If the thermocouple is OK, It shows that the program of the digital controller is broken. You will need to replace it for a new controller.

#### 5. The temperature is out of control: Set to 180°C, but the actual temperature is above 200°C.

- 1). This indicates that the solid-state relay is broken/ out-of-control; You will need to replace the relay.
- 2). Alternatively the digital controller could be faulty with an open circuit providing constant power; You will need to replace the controller.

#### 6. The setting temp and time becomes abnormal after you have replaced the heating element.

1). Please reset the temp and time according to this operators' manual.

#### 7. Maintenance.

- 1). In order to prolong the machine's service life, you should regularly lubricate all mechanical joints with light machine oil.
- 2). Care should be taken to protect the heating element whenever the machine is not in use. This will prolong the life of the element and help to keep the image quality of your work high.
- 3). The machine should be stored in a dry place.
- 4).The heating element is a consumable part and as such will need to be replace after approx. 700 transfer cycles. Replacement heating elements are available to purchase from <u>heatpressesdirect.com</u> that will allow approx. 2000 transfer cycles.
- 5). If you are not able to solve your problem, please contact <u>heatpressesdirect.com</u> for technical support.

## 8. The following checks should be carried out at regular intervals by a qualified and competent person:-

- Electrical connections
- Mechanical moving parts

### V. Trouble shooting for transfer print quality.

- If the print colours are pale: the temperature is too low / the pressure is not correct / or the transfer has not been pressed for long enough.
- 2. If the print colour is too brown or the transfer paper is almost burnt: reduce the setting temperature.
- 3. If the print is blurring: too much transfer time causes proliferation of the ink.
- 4. If print colour is different/ partial transfer effect is not good enough: the pressure is not enough / or the transfer has not been pressed for long enough / or poor quality transfer paper.
- 5. If transfer paper sticks to the Mug after transfer: the temperature is set too high/ or poor quality printing ink.

### **VI. Heating Element Temperature Measurement**

**Testing of the Heating Element** for temperature consistency or fault condition should only be undertaken after consulting a qualified engineer, and then only using a wired Digital Thermometer (\*please see note below).

\*Please Note:

**The Digital Thermometer with external probe** is suitable for surface, air and immersion/penetration measurement, which is required for all Heat Presses Diect heat presses.

**Laser Thermometers only measure air surfaces** which can be misleading due to currents of hot air floating on the surface of the heating Element.

### **VII. Electrical Diagram**
